

Threat Intelligence POC Presentation Flow

Screen-by-screen talking points for presenting the Slack threat-intelligence memory and automation proof of concept.

Core message	Keep Slack as the intake channel, but preserve analyst review memory in structured storage.
Use case	A Slack PDF advisory arrives, the app checks prior memory, then the analyst reviews evidence and records a decision.
Manager ask	Approve a small SharePoint and Power Apps pilot using the same fields and workflow.

Slide 1: Threat Intelligence

Introduce the idea. This POC captures threat-intelligence work from Slack and turns it into reusable memory for analysts.

- Say: The goal is to avoid repeating the same PDF or CVE review when on-call support changes.

Slide 2: The Operational Problem

Explain why the current Slack-only process loses useful review knowledge over time.

- Slack notes are useful in the moment.
- They are hard to search later.
- Analyst comments and decisions can get lost.
- The same PDF or CVE may be reviewed again.
- Say: The problem is preserving review knowledge, not only collecting PDFs.

Slide 3: Two-Phase Solution

Explain the two-step delivery approach.

- Phase 1 captures human notes and document memory.
- Phase 2 automates PDF analysis and evidence extraction.
- Say: We first store what analysts already know. Then automation adds CVE and evidence extraction.

Slide 4: End-to-End Architecture

Walk through the flow from Slack to analyst review.

- Slack is the intake channel.
- Python and Docker process the PDFs.
- The app stores structured document and finding memory.
- Power Apps and SharePoint are the production target.
- Say: For the POC this is local. For production, SharePoint becomes the structured memory layer.

Slide 5: Slack Becomes Intake Channel

Explain that the team can keep its existing starting point.

- Support teams continue posting PDFs and notes in Slack.
- The pipeline captures those notes and sender details.
- Say: We are not asking analysts to change their first workflow. Slack remains the intake point.

Slide 6: Dashboard

Show the manager-level operational summary.

- Documents processed.
- High attention items.
- Review required items.
- CVEs detected.
- Re-seen items.
- Analyst actions.
- Say: This screen gives managers and analysts a quick operational summary.

Slide 7: Phase 1: Slack Memory

Explain the first important analyst screen.

- Slack intake memory form.
- Document dropdown.
- Analyst note.
- Status and decision.
- Slack memory register.
- Say: This is where analyst notes become reusable memory.

Slide 8: Documents

Explain document-level tracking.

- One row per PDF.
- Document relevance.
- CVE count.
- PDF open link.
- Evidence tabs.
- Say: We changed the design to document-level memory so the same PDF does not appear repeatedly just because it has multiple CVEs.

Slide 9: Findings

Explain CVE-level review.

- CVE list.
- Technology.
- Review status.
- Evidence tab.
- Technology evidence tab.
- Say: This helps analysts understand why the system marked something important.

Slide 10: Re-seen Document Handling

Explain duplicate and repeat detection.

- The app can flag the same PDF coming again.
- The app can also flag a different PDF with the same CVE or technology.
- Say: This helps analysts see that previous analysis already exists.

Slide 11: What The POC Proves Today

Summarize the working capabilities.

- Slack intake.
- PDF download.
- CVE extraction.
- Evidence capture.
- Excel and local storage.
- Power Apps-style UI.
- Date filtering.
- Duplicate and repeat detection.
- Say: This is not just a mockup. We have working ingestion, storage, and review screens.

Slide 12: Path To SharePoint And Power Apps

Explain the production path.

- Local storage can be replaced with SharePoint lists.
- PDF files can move to a SharePoint document library.
- The UI can be recreated in Power Apps.
- Say: The same fields and workflow can move into the company Microsoft environment.

Slide 13: Use Case Walkthrough

Start the practical demo story.

- Say: Now I will explain one real use case from Slack PDF intake to analyst review.

Slide 14: Use Case

Walk through the four-step flow.

- Advisory arrives in Slack.
- The app checks memory.
- Analyst reviews evidence.
- Analyst records the decision.
- Say: The key value is that the next analyst does not start from zero.

Slide 15: Phase 1 Memory Screen

This is the main screen to explain.

- Show the date filter at the top right.
- PDFs in Period shows PDF documents received for the selected date range.
- Duplicate Activity shows duplicate or re-seen items.
- Related Repeats shows the same CVE or technology appearing again.
- Inputs Added shows analyst notes or manual inputs added in that period.
- Say: Here the analyst can filter by today, yesterday, this month, or a selected date or month.

Slide 16: Date And Month Review

Explain manager reporting value.

- How many PDFs came yesterday?
- How many notes did analysts add today?
- How many duplicate items appeared this month?
- Say: This helps answer daily and monthly questions without manually checking Slack.

Slide 17: Document Evidence View

Explain document-level detail.

- Document list.
- Open PDF link.
- Processed date.
- Status.
- Relevance.
- CVE count.
- Evidence tabs.
- Say: Each Slack PDF becomes a structured document record. In production, this PDF link can point to SharePoint.

Slide 18: Finding Evidence View

Explain CVE-level evidence.

- CVE.
- Vendor.
- Technology.
- Risk scores.
- Evidence tab.
- Tech Evidence tab.
- Say: This is important because the app shows why the technology was identified, using text from the PDF.

Slide 19: Duplicate And Related-Repeat Handling

Explain the memory logic.

- Duplicates are not only exact file matches.
- If a different PDF mentions the same CVE or technology, the analyst should still see the prior context.
- Example: If a new Exchange advisory comes next month, the analyst can see previous Exchange or CVE notes.

Slide 20: Power Apps Target Shape

Explain how this maps to the company environment.

- SharePoint stores documents, findings, comments, statuses, and decisions.
- Power Apps shows analyst review screens.
- Python continues PDF and Slack processing.
- Say: This design follows the shape of the tools the organization already uses.

Slide 21: Suggested Demo Flow

Use this as the closing slide.

- Current Slack notes are hard to reuse.
- The POC stores document memory.
- Screens show date filtering, documents, findings, and evidence.
- The ask is to pilot this with SharePoint and Power Apps.

Closing line: This POC keeps the existing Slack workflow but preserves important review knowledge in a structured place, reducing repeated analysis and giving analysts better context.
